Lotara

RECALL RESPONSE FOR NURSERY KITCHENS

“A food product has been recalled. Which of our kitchens received the affected batch, and has someone acted?”

Lotara turns an official recall notice into a targeted, evidence-backed response: it matches each kitchen’s deliveries against the exact **barcode + lot** criteria, sends an **AI investigator** to collect the label evidence that is missing, and tracks a **confirmed staff report** until a manager closes the case.

01 Who, problem, why now

FOR

The operations or food-safety lead at a caterer serving several nursery kitchens (crèches).

PROBLEM

- Recalls name batches, not brands. Name-only alerts flag every kitchen with the product.
- Lot codes are often not recorded at delivery, so the answer stays “unknown”.
- Follow-up across sites is phone calls and memory, with no evidence trail.

WHY NOW

- French recalls are open, machine-readable data (RappelConso).
- Models can now read packaging labels and use tools, if exact rules stay in charge.

02 How it works and where the data lives

1. Real RappelConso notice `2026-04-0331` saved with publication and retrieval times; deliveries per kitchen in **Aiven PostgreSQL**.
2. Exact rules sort every delivery: `RECORDED MATCH` `NOT MATCHING` `NEEDS EVIDENCE`
3. AI investigator (Claude, 7 allowlisted case-scoped tools, max 8 calls) finds the missing lot and asks that kitchen for a label photo.
4. AI reads the photo as **unconfirmed** and flags look-alikes (O vs 0). A person confirms; the rules re-check.
5. Kitchen sends a typed stock-check report; only the manager can mark `REVIEWED COMPLETE`.

STORED IN AIVEN

notices, deliveries, cases, label photos, AI runs and tool steps, staff reports, event log

GUARDRAILS

rules decide status; AI cannot override, cite unknown evidence or call food “safe”

03 Evidence it works

28 TEST CASES, 16 AFFECTED	CORRECT MATCHES	FALSE ALARMS	AFFECTED CONFIRMED
Name-only matching	16/27	11/12	16/16*
Exact rules on records	7/7	4/12	7/16
Lotara: rules + AI evidence	**11/11**	**1/12**	**11/16**

*Name-only flags everything, so it “finds” every affected kitchen by alarming 11 of 12 unaffected ones. Lotara resolved 7/9 missing-evidence cases; AI read 13/13 labels exactly; about US$0.18 per investigated case. Synthetic cases, one real notice, simulated confirmations.

ROUTE TO FIRST USERS

- Supervised recall drill on historical deliveries with one multi-site nursery caterer.
- Measure missed sites, false alerts and time to staff acknowledgment.
- Expand through caterers’ food-safety leads to crèche networks.

Live demo `01a16320-7504-70fc-b08b-06bc2a4c1c84-8080.eur-1.aiven.app/welcome` · Code `github.com/hadi-ce04/Lotara`

Hosted on Aiven Runtime + Aiven PostgreSQL · real notice replayed, synthetic kitchens · not a food-safety certification
